Touch Pro for Retail

Running your Business is just a touch easier with Touch Pro. With our years of expertise and design feedback from today's leading industry players, we worked to create a point-of-sale application designed to improve efficiency at the touch of a button.
Touch Pro is a revolutionary platform that underpins the entire operational environment and provides the retailer with complete management control of all aspects of the retail operation. Touch Pro is the key to providing excellent customer service, while delivering needed information to improve customer retention and profitability.

The ideal solution for Retail operations, such as busy shops, Supermarkets , Department Stores, Visitors Entrances, Gift Aid Donation Processing and many more.
Touch Pro's ease of use screen designer allows you to create screens with fully definable button sizes, colours and functions to suit your business.
This overcomes the industry problems of training and the costs involved each time new staff join.

We also Provide a unique and Professional bespoke development service and customised reporting. This allows Customers to maximise their POS investment and get the right information at the right time.
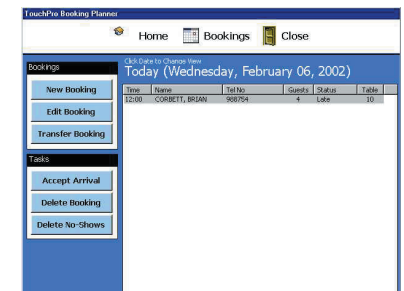

Touch Pro for Hospitality

Touch Pro is the ideal solution for food service management (FSM) operations, such as busy Bars Restaurants. With touch screen terminal options, multi–site management and reporting Touch Pro dramatically reduces your Total cost of ownership (TCO), we've got your POS concerns covered.
Need to split a Bill, access different menus, or tender a Bill to more than one payment type? Touch Pro makes it as simple as pointing your finger.

Another feature of Touch Pro is the booking planner this allows to check availability using our filtering system so you can enter numbers of guests, smoking or tables near windows etc.
You can then confirm the booking taking any notes required which can be passed to the waiter on arrival.

The virtual table planner this allows you to set-up your seating plans on screen in the shape of your restaurant. Quick filters are also available to show different seating plans in other locations in the building, also filters by seating types.

Menu's are easily navigated with operator instructions, this is useful for food allergy identification and mixing drinks, orders can then be sent to the kitchen via a kitchen printer or touch screen display.
Split Billing can easy be performed by tagging items in the bill and reassigning them to individual bills.

Customer information is easily collected using a quick address system and allocated against the transaction for customer tracking and marketing purposes
